

Vertical - Build Drilling

~~Horizontal Drilling~~

Low-inclination drilling is different than horizontal drilling, especially when considering the mechanics of the drill string. To ensure effective downhole friction breaking performance, it is important to use a downhole tool setup specific to the drilling application.

*The **5.25" SlidePro[®] Low-Angle Vibe Tool** was developed to maximize friction breaking when drilling verticals, tangents and build sections. This is accomplished by optimizing downhole tool placement and adjusting the shock tool setup.*
